

Advanced Python Multiple Choice Exam (100 Questions)

Each question below presents a snippet of code. Choose the correct output or behavior.

****Variables and Simple Data Types****

****1. What is the output?****

```
```python
```

```
x = [1, 2, 3]
```

```
y = x
```

```
x[0] = 100
```

```
print(y)
```

```
```
```

a) [1, 2, 3]

b) [100, 2, 3]

c) Error

d) None

****Answer: b****

****Default Arguments and Mutable Types****

****2. What is the result of the following code?****

```
```python
```

```
def f(a, L=[]):
```

```
 L.append(a)
```

```
 return L
```

```
print(f(1))
```

```
print(f(2))
```

```
```
```

a) [1], [2]

b) [1], [1, 2]

c) [1, 2], [1, 2]

d) [2], [2]

****Answer: c****

****List Comprehensions****

****3. Which output is correct?****

```
```python
```

```
x = [i*i for i in range(3)]
```

```
print(x)
```

```
```
```

a) [1, 2, 3]

b) [0, 1, 4]

c) [1, 4, 9]

d) [0, 1, 2]

****Answer: b****

****JSON Serialization with Custom Encoder****

****4. What does this produce (harder version)?****

```
```python
```

```
import json
```

```

class Spell:
 def __init__(self, name):
 self.name = name

 def __repr__(self):
 return f"Spell('{self.name}')"

def spell_encoder(obj):
 if isinstance(obj, Spell):
 return {'__spell__': True, 'name': obj.name}
 raise TypeError(f"Type {type(obj)} not serializable")

data = {"spell": Spell("Fireball")}
js = json.dumps(data, default=spell_encoder)
print(js)

```

- a) {"spell": "Spell('Fireball')"}
  - b) {"spell": {"\_\_spell\_\_": true, "name": "Fireball"}}
  - c) TypeError
  - d) SyntaxError
- \*\*Answer: b\*\***

**\*\*JSON Serialization (without encoder)\*\***

**\*\*5. What happens in this case?\*\***

```

```python
import json

```

```

class Spell:
    def __init__(self, name):
        self.name = name

data = {"spell": Spell("Fireball")}
print(json.dumps(data))

```

- a) {"spell": "Fireball"}
 - b) {"spell": "<Spell object>"}
 - c) TypeError
 - d) AttributeError
- **Answer: c****

****Exception Handling****

****6. Output of this code?****

```

```python
try:
 print(1 / 0)
except ZeroDivisionError:
 print("div by zero")
finally:
 print("done")

```

- a) div by zero
- b) done
- c) div by zero\ndone
- d) Error

**\*\*Answer: c\*\***

**\*\*Classes and Methods\*\***

**\*\*7. What is printed?\*\***

````python`

```
class A:
    def __init__(self):
        self.val = 5
    def double(self):
        self.val *= 2
```

```
a = A()
a.double()
print(a.val)
```
```

- a) 5
- b) 10
- c) None
- d) Error

**\*\*Answer: b\*\***

**\*\*Recursion\*\***

**\*\*8. What does this output?\*\***

````python`

```
def fact(n):
    if n == 0:
        return 1
    return n * fact(n - 1)
```

```
print(fact(4))
```
```

- a) 4
- b) 12
- c) 24
- d) 0

**\*\*Answer: c\*\***

**\*\*Generators\*\***

**\*\*9. Output of this generator?\*\***

````python`

```
def gen():
    for i in range(2):
        yield i * i
```

```
print(list(gen()))
```
```

- a) [0, 1]
- b) [1, 4]
- c) [0, 1, 4]
- d) [1, 4, 9]

**\*\*Answer: a\*\***

**\*\*Lambda Functions\*\***

**\*\*10. What is the result?\*\***

```
```python
f = lambda x: x + 2
print(f(3))
```
```

- a) 3
- b) 5
- c) 6
- d) Error

**\*\*Answer: b\*\***
